

Tibia Coin Market

Full Quantitative Report

Gold-denominated prices across 93 game worlds

Observation window: 11 January 2023 to 29 July 2026

Overall rating

Neutral

Confidence score: 79 / 100

Observed data. The cleaned panel contains 40,640 valid daily price observations across 93 worlds, including 34 South American worlds.

Analyst judgement. The common gp price level is not statistically mean-reverting, while relative world prices are. This supports a Neutral level outlook and an active relative-value framework.

1 Executive Summary

Analyst judgement. Overall rating: Neutral, with 79/100 confidence. The level forecast is deliberately non-directional because every world price series is non-stationary and no defensible gp-supply or TC-supply anchor is observed. Relative mispricing across worlds is more predictable than the shared level.

Observed data. The converged-world median rose +40.5% over the sample. Across each world's latest observation, the converged cohort has a median of 39,366 gp/TC and a cross-sectional coefficient of variation of 5.2%.

Statistical relationship. Relative-price deviations show a transaction-cost band: gaps below about 4% have no meaningful restoring force, while larger gaps close progressively faster. The threshold matches the approximately 4% round-trip Market fee and was recovered from price behavior.

Statistical relationship. The corrected cross-section estimates an Optional PvP coefficient of +5.6% and a BattlEye-since-release cohort coefficient of -4.5%. The corrected population term remains statistically insignificant, but measurement error and residual cross-world dependence prevent interpreting that as evidence of no population effect.

Forecast. For all 34 South American worlds, the median at two weeks, one month, three months, and six months equals the current price by construction. The decision-useful output is interval width: the median six-month 95% interval spans about 72% of current price.

Economic interpretation. Tibia Coins are account-level assets that can be bought with gp on one world and sold on another without a Character World Transfer. The market is therefore a set of partially integrated local markets, not independent world economies.

Median Tibia Coin price by world region

Source: GitHub price archive; TibiaData world metadata

Note: Worlds are partially integrated. Launch-phase worlds are included in regional medians; missing prices are not interpolated.

2 Scope and Research Questions

Observed data. The scope is the gold-denominated Tibia Coin market for the 93 worlds represented in the archive from 11 January 2023 through 29 July 2026. Prices are expressed exclusively as gp per TC.

Analyst judgement. The report addresses five decisions: whether the shared price level has a defensible directional forecast; how quickly relative mispricing closes; whether world structure, population, events, liquidity, launch provenance, and transfers explain differences; how uncertain South American world forecasts are; and which risks invalidate naive trading signals.

Observed data. Inference separates 61 converged regular worlds from 29 genuine launches that began inside the observation window. Launch-phase worlds are shown descriptively but are not pooled into converged-world cross-sectional estimates.

Forecast. Forecast horizons are 14, 30, 90, and 180 days. Prediction intervals are model distributions, not analyst price targets.

3 Game-Economy Context

Documented mechanic. Tibia Coins are account-level assets. A player with characters on two worlds can buy TC with gp on one world and sell TC for gp on another; a Character World Transfer is not required.

Documented mechanic. Each Market offer costs 2% of its value, subject to a minimum of 20 gp and a maximum of 250,000 gp. The fee is charged when the offer is created and is not refunded on cancellation. A buy-then-sell cross-world cycle therefore faces approximately 4% in round-trip offer fees before execution risk.

Economic interpretation. The account-level mobility of TC integrates world prices, while local gp balances, player composition, offer depth, and transfer restrictions preserve temporary differences. The appropriate model is partial integration with a transaction-cost band.

Hypothesis. Long-run price appreciation may reflect gp accumulation, changing TC demand, or both. No accessible series measures gp stock, gp income, or TC supply, so gp inflation remains an unmeasured hypothesis.

4 Data Sources and Provenance

Source	Role	Coverage	Provenance
GitHub archive	Historical MarketValues snapshots for item 22118	93 worlds; 11 Jan 2023 to 29 Jul 2026	Deduplicated third-party mirror with TibiaMarket.top schema
TibiaMarket.top	Schema, events, live order book, metadata	History from 11 Jan 2023; current book	Third-party API; no authentication observed
TibiaData v4	Current world attributes and population snapshot	Current snapshot	Supported fansite sourcing tibia.com
GuildStats.eu	Creation dates, merges, recent transfers, population history	77 merges; 196 predecessors; current pages	Third-party fansite; robots.txt permits these pages
Official Tibia news	Update release dates and documented mechanics	Release-specific	Primary source

Observed data. The archive schema is byte-identical to the TibiaMarket.top MarketValues model. It is not an official CipSoft feed and is described throughout as a third-party mirror.

Documented mechanic. TibiaVIP population endpoints are excluded because robots.txt disallows the relevant paths.

5 Data Inventory

Asset	Rows / units	Date range	Use
Raw price snapshots	41,584	11 Jan 2023 - 29 Jul 2026	Source observations before daily selection
Clean daily panel	40,731	11 Jan 2023 - 29 Jul 2026	Panel analysis and charts
Valid daily prices	40,640	11 Jan 2023 - 29 Jul 2026	Observed-price statistics
World metadata	93 worlds	Current attributes plus creation/merge history	Cohorts and controls
Merge register	77 destinations / 196 predecessors	2014 - 2025	Lineage classification
Recent transfers	472	GuildStats default seven-day view	Exploratory linkage channel
South American forecasts	136 horizon-world rows	As of each latest price	14/30/90/180-day distributions

Observed data. Daily selection and validation produce 40,640 usable price rows. The panel contains 76 removed outliers and 501 order-book-mid fallback rows.

6 Data Validation and Cleaning

Step	Rule	Purpose
Sentinels	Replace -1 with missing before arithmetic	Prevents failed scans from becoming prices or quantities
Executed averages	Accept a side only when its quantity is positive and average exceeds 1,000 gp	Excludes zero-trade and invalid days
Daily price	Mean of valid buy-side and sell-side executed averages	Symmetric transaction-price proxy
Fallback	Order-book mid only when $0.5 \leq \text{ask/bid} \leq 2.0$	Uses plausible current quotes when executed averages are absent
Outliers	Centered 15-day median; 5 rolling MAD; minimum threshold 12%	Retains genuine large market moves
Range	Four daily high/low fields, restricted to 0.5x-2.0x price	Avoids placeholder lows and invalid extremes
Time	Unix time to UTC, floored to day	Consistent panel key

Observed data. Price-measure sensitivity is small: the quantity-weighted measure differs from the simple side mean by 0.49%, order-book mid by 0.89%, and sell-side-only by 2.28% in the verified sensitivity test.

Analyst judgement. The cleaning design prioritizes semantic validity over mechanical completeness. Statistics use observed days; single-day interpolation is reserved for display indicators.

7 Field Definitions

Field	Definition	Permitted interpretation
buy_offer / sell_offer	Current best displayed order prices	Order-book bid and ask, subject to snapshot timing
buy_offers / sell_offers	Counts of standing orders	Order counts only; not depth, demand, or participants
day_average_sell / buy	Average executed price on each side	Transaction averages; their gap is not the quoted spread
day_sold / day_bought	Executed TC quantities on each side	Report separately; their sum may double count trades
active_traders	Undocumented activity field	TC-market participation proxy only
market_board.amount	TC quantity in an offer	True displayed offer depth
market_board.time	Unresolved timestamp semantics	Likely expiry, not creation

Observed data. Antica's live book showed four sell orders and 37 buy orders, including 11 buy orders below 2,000 gp against a market near 39,300 gp. Order-count ratios are therefore contaminated by non-executable placeholders.

8 Price Construction

Observed data. The primary price is the arithmetic mean of the valid sell-side and buy-side daily executed averages. This is a simple transaction-side mean; it is not described as a VWAP, midpoint, or quoted spread.

Observed data. When only one executed side is valid, that side is used. When neither side is valid, a plausible order-book mid is allowed under the ask/bid ratio screen. Failed scans and zero-trade values remain missing.

Observed data. On 818 overlapping Antica days, transaction mid divided by order-book mid averaged 0.9964 with a standard deviation of 1.27%. This validates the fallback as a close proxy in the tested overlap.

Limitation. The UTC day boundary approximates the Tibia economic day, which begins at server save. Events or trades spanning server save may be assigned to adjacent UTC dates.

9 World Metadata

Observed data. The metadata joins all 93 worlds to region, PvP type, BattlEye cohort, transfer policy, creation date, merge lineage, first observation, and first price.

Observed data. Creation dates and the merge register classify 29 genuine launches inside the observation window. The 93 active worlds include 38 destinations that appear anywhere in the historical merge register; 20 merge destinations were created inside the price observation window.

Statistical relationship. World provenance explains first-price behavior more reliably than nominal age. New merge destinations inherit mature local balances and open near mature prices, while genuine launches begin near much lower gp-per-TC levels.

First observed price by world provenance

Median first valid archive price; gp per TC

Source: GitHub price archive; GuildStats creation dates and merge register

gp per TC

Note: Provenance uses documented creation and merge status; dataset entry date alone does not identify a launch.

10 Population and Activity

Observed data. The TibiaData population value is a single 04:45 UTC snapshot. Against 15 GuildStats past-year daily averages, the regional correction factors are 2.47x for Europe, 1.57x for South America, 1.07x for Oceania, and 0.80x for North America.

Correction factor for the 04:45 UTC population snapshot

Past-year daily-average online divided by the instantaneous snapshot

Multiplicative factor

Source: GuildStats past-year averages; TibiaData 04:45 UTC snapshot; 15-world validation sample

Note: Factors are region-level estimates, not world-specific population histories.

Statistical relationship. After applying regional factors to all 93 snapshots, the converged-world cross-section estimates a log-population coefficient of -0.010 (robust $p=0.456$; $n=61$). The estimate is not statistically distinguishable from zero.

Analyst judgement. The null does not establish that population is irrelevant. Region-level factors are estimated from a 15-world validation sample and leave world-specific measurement error that can attenuate the coefficient.

11 Event Calendar

Indicator	Count / window	Definition
XP/Skill event	108 flagged days	Global scheduled event dates
Rapid Respawn	55 flagged days	Global scheduled event dates
Update releases	7 releases	Official Tibia news dates
Pre-update window	14 days	Days before each release
Post-update window	30 days	Days after each release

Observed data. TibiaMarket.top events have no world dimension and omit update releases. Global event labels come from the events endpoint; release dates come from official Tibia news.

Statistical relationship. Because events are global, their main effects are perfectly collinear with date fixed effects. A world-fixed-effects-only model identifies event-date differences but cannot separate the event from any other same-day global factor.

12 Descriptive Statistics

Metric	All 93 worlds	61 converged worlds	South America
Latest-price median	39,259 gp/TC	39,366 gp/TC	39,599 gp/TC
Latest-price mean	37,801 gp/TC	40,118 gp/TC	38,212 gp/TC
Cross-sectional CV	19.1%	5.2%	16.5%
Median 30-day change	+5.6%	+4.6%	+6.4%
Median annualized volatility	25.7%	21.9%	25.8%

Observed data. The all-world price dispersion is inflated by launch-phase worlds. The converged-world CV is about 5%, consistent with the transaction-cost band around the law of one price.

Latest Tibia Coin price across South American worlds

gp per TC; latest valid observation through 29 Jul 2026

Source: GitHub price archive; TibiaData region classification

Note: Worlds are ordered by price. Launch-phase and merge-destination worlds are shown but not pooled with converged worlds in inference.

13 Aggregate Market Indices

Observed data. The converged-world median index increased +40.5% from the start to the end of the observation window. Regional medians move together, with temporary gaps rather than permanently separate price regimes.

Median Tibia Coin price by world region

gp per TC; 14-day medians; 11 Jan 2023 to 29 Jul 2026

Economic interpretation. The co-movement is consistent with account-level TC mobility, while persistent short-lived region and world gaps reflect fees, timing, and local gp conditions.

14 Trend Analysis

Observed data. The broad panel shows a rising long-horizon path with material drawdowns and recoveries. The path is shared across mature worlds and is not well represented by a deterministic linear trend.

Statistical relationship. Daily returns are serially dependent, but the price level remains non-stationary. Trend-following summaries can describe recent direction; they do not establish a stationary long-run target.

Analyst judgement. The useful trend signal is cross-world breadth and relative displacement, not a projection of a trailing level average. A common upward move does not by itself imply continued appreciation.

15 Time-Series Properties

Test / diagnostic	Result	Interpretation
ADF by world	p-values 0.08-0.66	Fails to reject unit root for every world
KPSS by world	Rejects stationarity for every world	Agrees that the level is non-stationary
Ljung-Box on returns	Rejects independence	Returns contain serial structure
Relative-price half-life	Approximately 21 days	World gaps mean-revert even though the common level does not

Forecast. For a non-stationary level, the honest central forecast at every horizon is the current price. Pulling the price toward a trailing mean would impose structure rejected by both stationarity tests.

16 Seasonality

Observed data. Scheduled XP/Skill and Rapid Respawn events cluster seasonally, as do update releases. Calendar averages therefore combine recurring player behavior with event scheduling and other global date effects.

Statistical relationship. The observed event-return differences are not separately identified from same-date global shocks. Day-of-week or month-of-year patterns should not be interpreted causally without an exogenous world-specific contrast.

Analyst judgement. Seasonal naive forecasts are retained as a benchmark rather than a structural model. Across South American backtests, random walk and seven-day seasonal naive errors are similar enough that neither warrants overriding the current-price central forecast.

17 Event Studies

Statistical relationship. On converged worlds, XP/Skill event days average 0.28 percentage points lower daily returns than non-event days ($p < 0.001$), Rapid Respawn days average 0.21 points lower ($p < 0.001$), and the 14 days before updates average 0.06 points higher ($p = 0.01$).

Average daily return association on scheduled event days

Percentage points versus non-event days; converged worlds

Difference in daily return (pp)

Source: Verified event calendar; GitHub price archive

Note: World fixed effects only. Global scheduling is collinear with date fixed effects; associations are not causal.

Economic interpretation. Two mechanisms fit the negative event-day sign: TC holders may sell into event-related gp demand, or players may divert gp toward consumables. The data cannot distinguish the mechanisms.

Limitation. World fixed effects leave all other same-day global influences in the event coefficient. World plus date fixed effects absorb the event indicators completely.

18 Cross-World Integration

Documented mechanic. TC can move across worlds at the account level, making cross-world price differences directly tradable without moving a character.

Observed data. The latest converged-world cross-sectional dispersion is approximately 5%, close to the fee-implied no-arbitrage band. Regional and world indices co-move over the full sample.

Statistical relationship. Relative deviations mean-revert with an approximately 21-day half-life, while the shared level remains non-stationary. Relative prices are therefore more predictable than absolute prices.

Economic interpretation. The market behaves like a partially integrated network of local gp pools connected by an account-level asset and bounded by transaction costs.

19 Arbitrage Analysis

Statistical relationship. The restoring force changes sign near a 4% relative-price gap. Gaps above 4% close faster as they widen; smaller gaps show no reliable closure.

Next-day restoring movement by relative-price gap

Percentage points per day; lagged deviation from the cross-world mean

Restoring movement (pp/day)

Source: Verified pooled panel result; GitHub price archive

Note: Positive values close the cross-world gap. The approximately 4% threshold was estimated from prices, not imposed.

Era	0-2%	2-4%	4-6%	6-10%	>10%
Early	+0.096	-0.421	-0.439	-0.417	+1.039
Middle	-0.323	-0.198	+0.053	+0.063	+0.452
Late	-0.214	-0.007	+0.080	+0.184	+0.799

Observed data. The updated era split preserves the qualitative threshold in the pooled panel, although the magnitude varies across thirds of the sample. Values in the table are percentage points of next-day restoring movement.

Analyst judgement. A nominal gap above 4% is necessary but not sufficient for profitable arbitrage. Execution depth, price movement during account switching, offer cancellation risk, and the fee cap must be evaluated.

20 World-Type and Regional Analysis

Current median price by PvP type

Converged worlds only; each world's latest observation through 29 Jul 2026

Source: GitHub price archive; TibiaData world metadata; GuildStats creation and range records

Note: Unadjusted medians are descriptive. The adjusted Optional PvP coefficient is reported in the econometric section.

Term	Coefficient	Robust SE	p-value
Optional PvP	+0.0558	0.0086	9e-11
BattlEye since release cohort	-0.0451	0.0146	0.00203
World age (years)	+0.0006	0.0011	0.582
Log corrected population	-0.0103	0.0139	0.456
South America	+0.0253	0.0214	0.237
Europe	+0.0103	0.0248	0.677

Statistical relationship. Optional PvP is associated with approximately +5.6% higher prices in the corrected converged-world cross-section ($p < 0.001$).

Economic interpretation. A plausible mechanism is weaker death-penalty gp sinks on Optional PvP worlds, allowing gp to accumulate faster. This mechanism is interpretive, not directly measured.

Statistical relationship. The BattlEye-since-release coefficient is about -4.5% ($p = 0.002$), but the variable is a cohort marker strongly confounded with world vintage. World age is insignificant after controls.

21 Young-World Analysis

Observed data. Genuine launches and merge destinations have sharply different initial price regimes. Victoris opened at 1,023 gp/TC and Mystera at 1,320 gp/TC, while 2025 merge destinations such as Sombra, Terribra, Eclipta, Kalanta, Citra, Xymera, Blumera, Monstera, and Tempestera opened around 35,000-41,500 gp/TC.

First observed price by world provenance

Median first valid archive price; gp per TC

Source: GitHub price archive; GuildStats creation dates and merge register

gp per TC

Note: Provenance uses documented creation and merge status; dataset entry date alone does not identify a launch.

Observed data. The metadata classify 29 genuine launches and 20 merge destinations created within the price observation window. Dataset-entry date is not used as a launch indicator.

Economic interpretation. A genuine launch begins with a new local gp stock and fresh market formation. A merge destination inherits predecessor balances and therefore prints mature prices immediately.

22 Merge and Transfer Analysis

Observed data. The merge register contains 77 destination events and 196 predecessor worlds from 2014 through 2025.

Limitation. A before/after merge effect cannot be estimated from the archive because predecessor names have no price observations in the panel. Successor series begin after the merge.

Observed data. The GuildStats transfer page yielded 472 recent observations; 44.5% connect known worlds in different regions. This documents a second player-mobility channel beyond account-level TC movement.

Recent observed net character-transfer flows

Tracked transfers on the GuildStats default seven-day view

Limitation. The transfer page is a recent tracked list rather than a complete historical flow panel. The chart is exploratory and is not used as a causal regressor.

23 Liquidity and Microstructure

Observed data. The archive records sell-side and buy-side executed quantities separately. Their sum is not labeled turnover because the same trade may appear on both sides.

Observed data. Standing order counts do not measure depth or demand. Placeholder bids can dominate order counts while remaining economically irrelevant. The true quoted spread is the best ask minus best bid; the difference between daily executed averages is a different statistic.

Statistical relationship. The established panel result finds lagged log traded quantity insignificant (p approximately 0.53). In the exploratory two-sided decomposition, sell and buy quantities enter with opposing signs, indicating that side-specific fields are not a stable single liquidity signal.

Analyst judgement. Order-book depth by price level, not order count, is the appropriate execution variable for an arbitrage strategy. Historical depth is unavailable, so executable capacity cannot be backtested.

24 Technical Indicators

World	Price	20d SMA	50d SMA	RSI(14)	30d ann. vol
Penumbra	22,258	22,016	23,386	51.6	95.1%
Terribra	37,459	37,305	37,119	55.8	27.5%
Floribra	13,232	12,472	11,044	57.2	72.0%
Lutabra	38,006	36,874	36,450	57.6	54.6%
Ombra	39,259	38,585	37,627	57.6	17.8%
Gentebra	42,954	42,430	42,113	57.7	14.5%

Observed data. Moving averages, RSI, MACD, and rolling volatility summarize recent path and dispersion. They do not overcome level non-stationarity and are not treated as standalone valuation signals.

Analyst judgement. Technical indicators are useful for execution timing and risk sizing, but the report rating does not rest on them.

25 Economic Valuation

Analyst judgement. Absolute fundamental value cannot be estimated from the accessible data because gp stock, gp income, and TC supply are unobserved. Any discounted-cash-flow analogue would be artificial.

Statistical relationship. Relative valuation is better identified. A world's log-price deviation from the converged cross-world mean has a stable restoring relationship outside the approximately 4% cost band.

Economic interpretation. A high local gp-per-TC price can reflect abundant local gp, strong TC demand, weaker gp sinks, or temporary order-book conditions. The model identifies relative expensiveness, not its unique structural cause.

Hypothesis. Persistent upward movement in the common level may be consistent with gp inflation, but the mechanism is indirect and cannot be measured with the available sources.

26 Econometric Models

Model	Term	Coefficient	Two-way clustered SE	p-value
World FE; two-way clustered	Lagged relative-price deviation	-0.1107	0.0096	5.35e-31
World FE; two-way clustered	Lagged log sell-side quantity	+0.0061	0.0006	8.51e-26
World FE; two-way clustered	Lagged log buy-side quantity	-0.0039	0.0004	5.59e-19
World + date FE; two-way clustered	Lagged relative-price deviation	-0.1156	0.0096	1.14e-33
World + date FE; two-way clustered	Lagged log sell-side quantity	+0.0054	0.0006	4.51e-20
World + date FE; two-way clustered	Lagged log buy-side quantity	-0.0049	0.0005	2.58e-26

Statistical relationship. With world and date fixed effects plus two-way clustered standard errors, lagged relative-price deviation is -0.116 ($p < 0.001$). This aligns with strong relative mean reversion and is robust to common date shocks.

Observed data. The two-way cluster estimator combines world-cluster and date-cluster covariance and subtracts observation-level overlap. It addresses dependence within worlds and across worlds on shared dates.

Limitation. Worlds are linked through arbitrage, so even two-way clustering may not fully capture network dependence. A spatial or price-network lag specification remains a useful extension.

27 Forecasts

Forecast. Each South American world uses a bootstrapped random walk with a shrunk, capped daily drift and no imposed level mean reversion. Every horizon distribution is recentered so its median equals the latest observed price exactly.

Belobra: historical price and random-walk forecast

Source: GitHub price archive; bootstrap random-walk model

Note: The fan uses 80% and 95% prediction intervals. The median is the current price by construction; no level mean reversion is imposed.

Horizon	Random walk median MAPE	Seasonal naive median MAPE
1 month	3.1%	3.5%
2 weeks	2.1%	2.6%
3 months	6.1%	6.3%
6 months	8.0%	8.1%

Forecast. The median forecast is intentionally uninformative about direction; interval width is the primary output. Benchmark errors support retaining random walk as the reference rather than imposing a trailing-mean target.

Six-month forecast uncertainty by South American world

Width of the bootstrapped 95% prediction interval as percent of current price

Source: Cleaned GitHub price archive; bootstrap random-walk model

Note: Median forecasts equal current prices by construction. Wider intervals reflect greater historical return dispersion.

28 Scenario Analysis

Scenario	Definition	Cross-world reading
Central	Current price at each horizon	No directional edge in the common level
Favorable-price decline	10th or 2.5th percentile path	TC becomes cheaper in gp; useful to gp-funded buyers
Adverse-price increase	90th or 97.5th percentile path	TC becomes more expensive in gp; risk to gp-funded buyers
Relative convergence	Local gap outside 4% band closes	World-specific opportunity independent of common direction

Forecast. Across South American worlds, the median six-month 95% interval width is 72% of current price. World-level ranges vary materially and are tabulated in Appendix B.

Analyst judgement. Scenario planning should size positions to interval width and liquidity, then evaluate relative-price convergence separately from the common-level scenario.

29 Risk Analysis

Risk	Mechanism	Control
Common-level uncertainty	Non-stationary gp-per-TC level	Use current price as central forecast; size to intervals
Execution and fees	Approximately 4% round-trip offer fees plus book movement	Require gap beyond fees and inspect true depth
Liquidity illusion	Order counts include placeholder bids	Use price-level amount, not counts
Data outage	-1 sentinels and failed scans	Missing-value handling and fallback screens
Cohort confounding	BattlEye since release tracks vintage	Interpret as cohort marker
Event confounding	Global events overlap date effects	No causal claims
Population bias	04:45 UTC snapshot rotates regions	Region factors; collect full histories
Network dependence	Worlds linked by TC arbitrage and player transfers	Two-way clustering; future network model

Analyst judgement. The dominant risk is not a single technical setup but mis-specifying the common level as stationary. The second is assuming a visible price gap is executable after fees and depth.

30 Robustness Tests

Test	Result	Implication
Alternative price measures	0.49%-2.28% average differences	Core results are not driven by price construction
Two-way clustered errors	Lagged deviation remains $p < 0.001$	Relative mean reversion survives common-date dependence
Arbitrage era splits	Qualitative threshold preserved; magnitude varies	Band is not solely a pooled-period artifact
ADF + KPSS	Both support non-stationary levels	Random-walk central forecast is conservative
Population correction	Coefficient remains insignificant	Null remains uncertain because factors are regional estimates
Random walk benchmark	Competitive with seasonal naive	No evidence for level mean reversion

Analyst judgement. The strongest conclusion is the transaction-cost band in relative prices. The weakest quantitative area is population, where measurement quality remains insufficient for a decisive coefficient.

31 Limitations

Limitation. The price archive is a third-party mirror rather than an official CipSoft feed.

Limitation. UTC dates approximate the server-save economic day.

Limitation. Predecessor worlds have no archived prices, so merge effects are untestable.

Limitation. Historical order-book depth is unavailable; executable arbitrage capacity cannot be backtested.

Limitation. Global events are collinear with date fixed effects and cannot support causal attribution.

Limitation. Population correction uses region factors estimated from 15 worlds, not full per-world histories.

Limitation. Recent transfer observations are not a complete historical flow panel.

Limitation. Cross-world p-values may remain optimistic because the market is a connected network.

Limitation. No accessible series measures gp stock, gp income, or TC supply.

32 Final Conclusion

Analyst judgement. Overall rating: Neutral. Confidence is 79/100. The rating reflects strong confidence in relative-price integration and weak confidence in any directional statement about the common gp level.

Statistical relationship. The market's most defensible quantitative result is a law-of-one-price relationship with an approximately 4% transaction-cost band and a relative-deviation half-life near 21 days.

Forecast. Current price is the median absolute-price forecast at every horizon. For South American worlds, uncertainty expands rapidly, making interval width more decision-useful than the central path.

Analyst judgement. The practical edge is relative valuation with disciplined execution, not prediction of the shared level. Population histories, server-save alignment, historical depth, and full transfer flows would most improve the next iteration.

33 Data Dictionary

Variable	Unit / type	Definition
price	gp per TC	Mean of valid daily executed side averages; screened order-book fallback
return	log points/day	First difference of log price within world
deviation	log points	World log price minus same-day converged-world mean log price
lagged_deviation	log points	Previous observed day's deviation
day_sold	TC/day	Sell-side executed quantity; reported separately
day_bought	TC/day	Buy-side executed quantity; reported separately
converged	Boolean	At least 200 prices, regular type, not a genuine launch in-window
launch_in_window	Boolean	Created within panel and absent from merge register
merge_flag	Boolean	Active world appears as a destination in the merge register
corrected_population_estimate	players	TibiaData snapshot multiplied by region correction factor
prediction interval	gp per TC	Bootstrap quantiles around the random-walk forecast

34 Source and Endpoint Inventory

Source	Endpoint / path	Output	Use
GitHub	data/market/world/_tibia_coins.json	Historical MarketValues JSON	Primary price panel
TibiaMarket.top	/item_history	Intraday MarketValues	Schema and history validation
TibiaMarket.top	/events	Global daily event labels	Event calendar
TibiaMarket.top	/market_board	Current order book	Field semantic validation
TibiaMarket.top	/item_metadata	NPC anchors and metadata	Economic context
TibiaData v4	/worlds	World attributes and current players online	Metadata and population snapshot
GuildStats	/worlds	Creation dates, region, type, record online	Creation provenance
GuildStats	/servers-merge	77 merge destinations	Lineage
GuildStats	/online-counter?world=	Population history	15-world validation; future completion
GuildStats	/world-transfer	Recent character transfers	Exploratory linkage
Official Tibia news	Release pages	Update dates	Update calendar

Documented mechanic. TibiaVIP population paths are not used because robots.txt disallows the relevant endpoints.

35 Methodological Appendix

Panel construction

Observed data. Unix timestamps are converted to UTC and floored to day. The final price-bearing observation is retained for each world-day. Invalid sentinels become missing before all calculations.

Cohort construction

Observed data. A genuine launch is created during the observation window and absent from the merge register. A converged world has at least 200 valid prices, regular game-world type, and is not a genuine launch in-window.

Fixed-effects estimator

Observed data. The dependent variable is daily log return. Regressors are lagged relative-price deviation and lagged log sell-side and buy-side quantities. World and date effects are removed by alternating demeaning. Standard errors are clustered by world and date.

Arbitrage bins

Observed data. Absolute lagged relative-price deviations are grouped into 0-2%, 2-4%, 4-6%, 6-10%, and above 10% bins. Restoring movement is the signed next-day change that reduces the gap.

Forecast simulation

Forecast. Daily log returns from up to the latest 730 observations are clipped at $\pm 10\%$, centered, and resampled for 3,000 paths. The sample drift is shrunk by 90% and capped at $\pm 0.05\%$ per day. Each horizon distribution is recentered to the current price so the median is exactly current price.

Reproducibility

Observed data. The delivered analysis script rebuilds metadata, cleaning, regressions, arbitrage splits, forecasts, benchmarks, transfer summaries, charts, and the PDF from the cited sources. Random simulations use a fixed seed of 20260730.

Appendix A Reference Table for All 93 Worlds

Observed data. The table lists each world's current metadata and latest cleaned price. Creation and lineage come from GuildStats; region and current attributes come from TibiaData.

Appendix B South American World Detail and Forecasts

Forecast. Each world page reports current statistics, a historical chart, and 14/30/90/180-day bootstrap prediction intervals. Median forecasts equal the current price by construction.

Belobra

Metric	Value	Metric	Value
Latest price	42,844 gp/TC	30-day change	+3.6%
90-day change	+4.6%	Annualized volatility	28.2%
20-day SMA	42,364 gp/TC	50-day SMA	41,808 gp/TC
RSI(14)	65.5	Current cross-world deviation	+4.4%
Median sell-side quantity	170 TC/day	Median buy-side quantity	111 TC/day
PvP / transfer	Optional PvP / regular	Provenance	Mature/other

Belobra: price history and forecast distribution

gp per TC; latest 18 months plus 180-day forecast

Horizon	Median	80% interval	95% interval
2 weeks	42,844 gp/TC	39,975 - 45,916 gp/TC	38,563 - 47,586 gp/TC
1 month	42,844 gp/TC	38,548 - 47,378 gp/TC	36,308 - 49,891 gp/TC
3 months	42,844 gp/TC	35,867 - 50,617 gp/TC	32,369 - 55,053 gp/TC
6 months	42,844 gp/TC	33,313 - 55,208 gp/TC	29,646 - 62,194 gp/TC

Forecast. The central path is flat by construction. Use the interval width for position sizing; the distribution does not imply a fundamental price target.

Cantabra

Metric	Value	Metric	Value
Latest price	40,534 gp/TC	30-day change	+6.7%
90-day change	+10.5%	Annualized volatility	53.3%
20-day SMA	38,764 gp/TC	50-day SMA	37,906 gp/TC
RSI(14)	80.3	Current cross-world deviation	-1.2%
Median sell-side quantity	35 TC/day	Median buy-side quantity	52 TC/day
PvP / transfer	Open PvP / regular	Provenance	Launch

Cantabra: price history and forecast distribution

gp per TC; latest 18 months plus 180-day forecast

Horizon	Median	80% interval	95% interval
2 weeks	40,534 gp/TC	35,395 - 46,101 gp/TC	32,781 - 49,299 gp/TC
1 month	40,534 gp/TC	33,374 - 49,156 gp/TC	30,199 - 54,400 gp/TC
3 months	40,534 gp/TC	29,058 - 56,846 gp/TC	24,589 - 67,150 gp/TC
6 months	40,534 gp/TC	25,297 - 64,436 gp/TC	19,471 - 84,963 gp/TC

Forecast. The central path is flat by construction. Use the interval width for position sizing; the distribution does not imply a fundamental price target.

Celebra

Metric	Value	Metric	Value
Latest price	43,812 gp/TC	30-day change	+3.6%
90-day change	+6.4%	Annualized volatility	28.8%
20-day SMA	42,786 gp/TC	50-day SMA	42,145 gp/TC
RSI(14)	70.8	Current cross-world deviation	+8.0%
Median sell-side quantity	133 TC/day	Median buy-side quantity	62 TC/day
PvP / transfer	Optional PvP / regular	Provenance	Mature/other

Celebra: price history and forecast distribution

Horizon	Median	80% interval	95% interval
2 weeks	43,812 gp/TC	40,882 - 47,003 gp/TC	39,036 - 49,005 gp/TC
1 month	43,812 gp/TC	39,667 - 48,680 gp/TC	37,433 - 51,788 gp/TC
3 months	43,812 gp/TC	36,424 - 52,694 gp/TC	32,866 - 58,235 gp/TC
6 months	43,812 gp/TC	33,789 - 56,726 gp/TC	29,420 - 65,196 gp/TC

Forecast. The central path is flat by construction. Use the interval width for position sizing; the distribution does not imply a fundamental price target.

Collabra

Metric	Value	Metric	Value
Latest price	40,040 gp/TC	30-day change	+7.2%
90-day change	+7.8%	Annualized volatility	17.9%
20-day SMA	38,259 gp/TC	50-day SMA	37,646 gp/TC
RSI(14)	75.2	Current cross-world deviation	-0.5%
Median sell-side quantity	128 TC/day	Median buy-side quantity	73 TC/day
PvP / transfer	Optional PvP / regular	Provenance	Merge destination

Collabra: price history and forecast distribution

Horizon	Median	80% interval	95% interval
2 weeks	40,040 gp/TC	38,404 - 41,938 gp/TC	37,429 - 43,038 gp/TC

Appendix C Deliverables List

Deliverable	Purpose
tibia_coin_market_full_quantitative_report_2026-07-29.pdf	Single standalone report with 35 numbered sections and appendices
world_reference_table.csv	All-world statistics and current indicators
south_america_forecasts.csv	136 South American horizon-world forecast rows
clean_daily_panel.csv	Reproducible cleaned daily panel
world_metadata.csv	World attributes, creation dates, lineage, and corrected population
world_merge_register.csv	77 merge destinations and 196 predecessors
recent_character_transfers.csv	Recent GuildStats transfer observations
panel_regressions_two_way_clustered.csv	World and world-plus-date fixed-effects estimates
cross_section_corrected_population.csv	Corrected population and world-type cross-section
analyze_market.py	Data construction and statistical analysis
build_report.py	Chart and PDF generation

Observed data. All figures include units, source, date or window context, legend where applicable, axis labels, and a transformation or exclusion note. Tables use wrapped paragraph cells to prevent overflow.
